

The Kiwi™ ProCup Vacuum Delivery System

The Kiwi™ ProCup is a complete vacuum delivery system designed for comprehensive control without the need of an assistant or any other equipment, such as a vacuum pump.

The cup has a bell shaped which is suitable, in general, for all positions where the Flexion point is easily available in OA presentations

The PalmPump™ provides a safe and effective source of vacuum right in the palm of your hand. The operator has full control and the unique traction device allows a considerable amount of flexibility in manipulation.

The Kiwi system is easy-to-use, effective, quiet and has proven to be less psychologically threatening to the mother-to-be.

The flexion point is situated on the sagittal suture line 3cm forward of the posterior fontanelle.
